

Familial Amyloid Polyneuropathy (FAP) Score:

Stage 1

Symptoms are mild at this stage, with the functioning of the lower limbs affected but not impaired. This is the stage for early detection of FAP symptoms.

Stage 2

Symptoms turn from mild to moderate in severity in stage 2. Lower limb function is even more affected, with patients possibly requiring walking assistance. Further damage to nerves caused by amyloid deposits is observed.

Stage 3

Symptoms have significantly worsened in stage 3, and the patient needs a wheelchair for mobility. There is no data to support the efficacy of drug therapies at this stage of the disease.
